## **ABSTRACT**

Take a moment and imagine your life without social media.

Ever wondered why most people need or at least think they need social media?

It's because we seek validation. We always want to feel wanted and accepted; nobody wants to feel like they don't belong. It's because we're humans.

The first and the most important thing about living without social media; you'll learn the true meaning of private life.

**KEYWORDS:** Negative and Positive effects; Social Media; Youth;

## **INTRODUCTION**

Without social media, life would inevitably vary. Interacting with someone would have to be in person. It would mean less time surfing on social networks and more time spent in real life. Asking someone to hang out via social networks sounds easier and in case you get rejected you probably will not feel that hurt. However, asking someone out in real life makes you feel jittery. Facial expressions are seen, the cracking sound of your voice is heard and the beating rhythm of your heart can be felt. It is always easier to play it off behind the screen than face it out in reality. Using pick-up lines in real life makes the whole conversation awkward, the struggle becomes real when you have to compose a quick witty, flirtatious response and fail to do so within the next 10 seconds before the conversation changes.

If we want to simply interpret the more and more of the Internet available today, we must say that it is like to consider the universe as a class in which we are constantly interacting with each other.

Indeed, how will our life be without this transaction? How will today's society live if the Internet is eliminated?

The easiest way to answer is to go back to the years before the Internet was euthanized, the 1990s, when the phone lines were only fixed, and instead of the CDs, were VHS tapes. But this historical fact does not correctly answer this question, because at that time we did not know what opportunities we had. On the contrary, now, there was no Internet to infiltrate our world that life without it is difficult. The notion of a world without a note today is like the notion of London in the 1840s without steam, and New York in the 1930s without a lift, and Los Angeles in the 1970s without a car.

The Internet has significantly changed our cultural understanding of patience. Without the internet, we lose the pleasure we find that we are looking for in real time: we quickly get online answers, and in the short term we get the product we are looking for. So the idol of the Internet, waiting and waiting is virtually gone.

Before the Internet was eclipsed, the enthusiasts devoted less than one hour of their time to online spending a week on the Internet, with 85 percent of Americans today using the Internet. A MIT professor who is researching online behavior believes that having the Internet in our pockets has greatly affected our relationships. He points to a recent article from the University of Michigan that, according to ongoing research from past to present, the empathy of individuals has dropped by 40 percent over the past 30 years.

Not having Internet has a lot to do with our personal life. Aside from the fact that teenagers will not be logged in to their social networking accounts, the degree to which this issue affects us depends heavily on our dependence on the Internet. Some of us use very little of the internet, while others rarely disconnect from the Internet, so that for those categories of people, living without the internet, it's like having another life.

In terms of communicating with others, human beings today use more than any other Internet connection to communicate. So, without the Internet, our communication methods must change. Of course, we will not use smoke as a signal, but paper letters will take the place of email and fill the gap phone that has created instant messages, chat and social networks.

If you want to specify a location on a map of the world, you may go to your own book.

In the absence of online facilities, you will spend a significant part of your time in the long ranks of banks, post offices, or government departments. For days or even weeks, you have to wait for your letter from the rest of the world to reach you. Suddenly you will notice that your life, which used to be a fast track, has been very slowly played.

## **SOCIAL AFFILIATION**

Many of us use the internet to contact friends and relatives. If you are accustomed to social networking online, if you do not have the Internet, you will not find a way to share your latest travels with friends around the world.

Meeting and engaging with people who live outside of your area will be difficult and difficult. Maybe join a club or community in your neighborhood to find new friends. You will have to use the phone to be able to talk to your family and friends. In the absence of online social media, you will often say that you should go see them and chat with them.

## **CONNECTING**

When communicating via email, instant messaging, chat, or social media is not possible, we will have to resort to old ways of communicating with people. We will have to choose options for meeting face-to-face, telephone conversations, or sending and receiving letters.

Communicating through the Internet is free, while other forms of communication are time consuming and costly. You have to write a letter and buy the stamp to send it, which is what we used to do before the Internet. Post offices and telephone service providers will benefit greatly from increased demand for their services.

## **INFORMATION**

The Internet has become a huge source of information and resources. The lack of the Internet means that one cannot quickly and easily access the information with just one click. For information, you need to go to the neighborhood library and virtually move the entire library to get the information you need and, of course, you can quickly find what you want very little.

Students who are accustomed to complete their homework and projects through the Internet will face difficulties and will have to choose an alternate option. Students or students are forced to attend school or college. For news, you will have to go to the TV or the morning newspaper.

## **WORKPLACE**

Everything will be in your workplace. If your work is mainly done with the help of the Internet, your company may have to shut down your work. If you use part of the Internet at your workplace and, for example, use an online system to get figures and statistics from the Internet, this simple and easy task will become a complex and time consuming process.

Organizations will have to radically change their practices and processes to survive. Your desk will be full of records and records, and their search and categorization will turn into a nightmare.

## **TRADE AND ECONOMICS**

Without the Internet, the world economy will suffer the most. The emergence of a long-term economic downturn in the world will cause millions of people to lose their jobs and many businesses shut down. The economy is shrinking and will be limited to local merchants and shops. For many industries, it may not be possible to do business with cities or other countries.

The price of goods will rise because of the fact that players in local markets will face less competition. The speed of business operations, which is possible thanks to the Internet, will be slower. Most transactions will be done manually, and most commercial communications will be possible through mail and courier services. The demand for jobs that do not work with the Internet will increase sharply.

Before the Internet became part of our lives, we were able to manage our lives. And if the internet was to be out of our day, surely without it we would be able to manage our lives, although it might well be the time to use the internet. We cannot do this.

But the good news is that, given the widespread scope of global infrastructure and the breadth of Internet technology, the emergence of this hypothetical situation is highly unlikely. So, enjoy and enjoy the life of the Paradise that we call the Internet, because in the future, there will be more Internet technologies and initiatives that will evolve and act in a way that will change our lives.

According to the forecast, by the year 2021, about 60% of the world's population will have regular access to the Internet, and a large share of this figure is related to the mobile Internet.

According to data released by the we are social site, there are currently more than 4 billion Internet users worldwide.

Accordingly, the number of Internet users in the world by the beginning of 2017 has exceeded 4 billion users, and now more than 60% of the world's population is online and have access to the Internet.

The fall in Internet prices and the rise in global incomes in 2016 have caused more than 700 million people worldwide to access the 500-megabyte Internet on average per month.

Meanwhile, users outside of the 3G and 4Gs reached 1.6 billion, compared to 2 billion in 2014, the new 1.6 figure represents improved mobile communications bandwidth.

On the other hand, it has been estimated that more than 500 million people from India arrived online in 2017, with 400 million of them accessing the Internet via mobile phones; now there are 350 million Indian Internet users, of which 152 million are mobile users.

In the US and Europe, 78% of mobile users are mobile users, and 69% of the world is covered by third-generation mobile services, but only 29% of rural areas are provided.

More than 3 billion people worldwide use social media every month; 9-10 of these users have access to cyberspace through their mobile devices.

More than 200 million people got their first mobile device in 2017, and two-thirds of the 7.6 billion people in the world now have mobile phones.
